Notes

Date: 2022.12.08

- Sharing what we did in the past week
- Postman testing (Keep up testing through postman)
- The diagram should be made based on the new version that Natalia sent
- Single persistent database and each microservice contains one
- previous architecture feedback :
  - Payment is not required (it is fine to remove), but as we have it in the code we can just keep it.
  - hexagonal architecture is not required (DDD is not a hard requirement. Microservice is a hard requirement. Some non-functional functionality such as spring security is still required, but there are no other hard requirement that we haven't done.
- It is important to know when do we check the token for the authorization,
  - it is important to explain and reason about the way we did it in the report.
  - Every request should be authorized.
- Merge dev to main more frequently, preferably Tuesday
- Change in template is necessary (it is already done to some extent)
- Renaming products in order microservice should be done next week, however, it is also fine with our current
- Merge request comments are enough (Bogdan, and Kristof might need some more comments for merge requests)
